

Mobeye water alarm

CM4300 Mobeye WaterGuard

The archive, the wine or the holiday gear; the cellar usually contains valuable stuff. Great storage, as long as it stays dry.

Mobeye leakage monitoring provides insight whether there is water in the Cellar and helps to prevent damage.

Instant alarming when water is detected

The Mobeye WaterGuard send alarm messages as soon as the water sensor detects water-based liquids. The device includes an integrated 2G / 4G LTE-M communication module. The notification is sent as push message via the Mobeye Messages App, or as call, SMS, e-mail.

Power outage monitoring

The Mobeye WaterGuard can work for a year on the (supplied) set of batteries. It is possible to connect external voltage. By simply plugging the power adapter into the wall socket, the voltage source is also monitored directly. In the event of a power failure, an alarm message follows and the batteries take over the function. Alarm and test messages are then still sent.

CM4300 versus CM4300-FS

The Mobeye CM4300 is extremely suitable for the detection of small amounts of water. In very humid environments we recommend the CM4300-FS. This has a float sensor and reacts when the difference in the water level is a few centimeters.
